

Customised Transport solution for cartridges

As partner of one of the world's leading pharmaceutical manufacturers in the field of metabolic diseases, diabetes and cancer, Utz team was trusted in commissioning design, development and production of the returnable and reusable customised plastic transport unit for glass cartridges.

The key functionality for such a transport unit is to enable the loading of cartridge at the glass manufacturer and then shipped to the filling pharmaceutical company.

Hence, as solution, which serves multiple operations by various organisations, for instance, primary glass vials & cartridge manufacturer, shipment through logistics supply chain, goods receive operations at filling site, suitability for automated filling operations, and warehousing. Due to the different automation requirements of the supplier and the end customer, a solution was created that allows both parties to operate smoothly.

The special feature lies not only in the design, but also in the production of the article. Due to the high cleanliness and hygiene requirements, further measures were implemented in addition to the standard injection molding process to meet quality and regulatory needs.

The returnable and reusable customised transport unit is manufactured in a dedicated production area controlled air circulation. The final transport units were packaged in an individual transport unit to protect it from external influences, making it fit for end-to-end operations at multiple sites.

Customised Transport solution for cartridges

Do you know, Utz Group is trusted by world's leading 500+ Pharma and Med Tech organisations, to design, develop and produce customised solutions for returnable and reusable logistics and transport packaging.

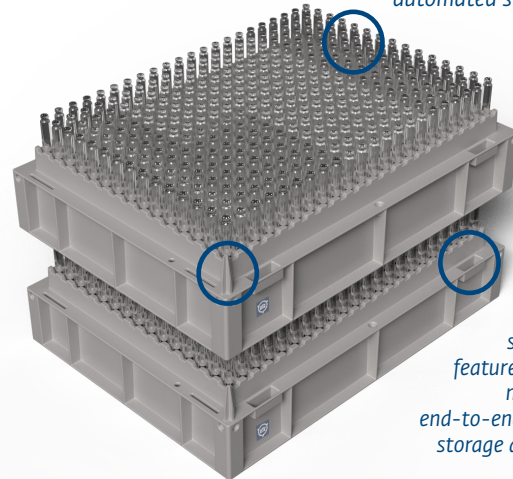

With its presence around the globe (8 production sites and local sales team), Utz Group is always offer best solutions to meet your global and local supply chain needs.

On-Time-In-Full Delivery is ensured by a team of experts from designers to injection molding engineers, is led by a dedicated customer Key Account Manager and a Project manager who work with all relevant parties involved (glass manufacturer, automation line manufacturers, fillers and the customer).

It is not a surprise that quantities ranging in the six-figure have been produced in ever expanding collaboration.

precise design specification ensure the transport unit is fit for highly automated supply chains

special design features included to meet needs of end-to-end production, storage and shipment
